For the avoidance of doubt, the terms listed below are to be understood to have the following meaning throughout the present description and claims:

The term "lower", when referring to organic radicals or compounds means a compound or radical with may be branched or unbranched with up to and including 7 carbon atoms.

A lower alkyl group may be branched, unbranched or cyclic and contains 1 to 7 carbon atoms, preferably 1 to 4 carbon atoms. Lower alkyl represents, for example: methyl, ethyl, propyl, butyl, isopropyl, isobutyl, tertiary butyl or 2,2-dimethylpropyl.

A lower alkoxy group may be branched or unbranched and contains 1 to 7 carbon atoms, preferably 1 to 6 carbon atoms. Lower alkoxy represents, for example: methoxy, ethoxy, propoxy, butoxy, isopropoxy, isobutoxy or tertiary butoxy. Lower alkoxy includes cycloalkyloxy and cycloalkyl - lower alkyloxy.

A lower alkene, alkenyl or alkenoxy group is branched or unbranched and contains 2 to 7 carbon atoms, preferably 1 to 4 carbon atoms and contains at least one carbon-carbon double bond. Lower alkene, lower alkenyl or lower alkenyloxy represents for example vinyl, prop-1-enyl, allyl, butenyl, isopropenyl or isobutenyl and the oxy equivalents thereof.

In the present application, oxygen containing substituents, e.g. alkoxy, alkenyloxy, alkynyloxy, carbonyl, etc. encompass their sulphur containing homologues, e.g. thioalkoxy, thioalkenyloxy, thioalkynyloxy, thiocarbonyl, sulphone, sulfoxide etc.

Halo or halogen represents chloro, fluoro, bromo or iodo.

Aryl represents carbocyclic aryl, heterocyclic aryl or biaryl.

Carbocyclic aryl is an aromatic cyclic hydrocarbon containing from 6 to 18 ring atoms. It can be monocyclic, bicyclic or tricyclic, for example naphthyl, phenyl, or phenyl mono-, di- or trisubstituted by one, two or three substituents.

Heterocyclic aryl is an aromatic monocyclic or bicyclic hydrocarbon containing from 5 to 18 ring atoms one or more of which are heteroatoms selected from O, N or S. Preferably there are one or two heteroatoms. Heterocyclic aryl represents, for example: pyridyl, indolyl, quinoxaliny, quinoliny, isoquinoliny, benzothienyl, benzofuranyl, benzopyranyl, benzothiopyranyl, furanyl, pyrrolyl, thiazolyl, oxazolyl, isoxazolyl, triazolyl, tetrazolyl, pyrazolyl, imidazolyl, thienyl. Heterocyclic aryl also includes such substituted radicals.

Cycloalkyl represents a cyclic hydrocarbon containing from 3 to 12 ring atoms preferably from 3 to 6 ring atoms. Cycloalkyl represents, for example: cyclopropyl, cyclobutyl, cyclopentyl, or cyclohexyl. The cycloalkyl may optionally be substituted.

Heterocycloalkyl represents a mono-, di- or tricyclic hydrocarbon which may be saturated or unsaturated and which contains one or more, preferably one to three heteroatoms selected from O, N or S. Preferably it contains between three and 18 ring atoms. The term heterocycloalkyl is intended also to include bridged heterocycloalkyl groups such as 3-hydroxy-8-aza-bicyclo[3.2.1]oct-8-yl.

Pharmaceutically acceptable prodrug esters are ester derivatives which are convertible by solvolysis or under physiological conditions to the free carboxylic acid of formula (I). Such esters are for example lower alkyl esters (such as methyl or ethyl esters), carboxy-lower alkyl esters such as the carboxymethyl ester, nitrooxy-lower alkyl esters (such as the 4-nitrooxybutyl ester).

Referring to formula (I), preferably Z is NH, NCH₃, CH₂, S or O.

R is preferably hydroxy, an optionally substituted lower alkoxy, alkenoxy, cycloalkyl-lower alkyloxy, aryloxy, heteroaryloxy, aryl-lower alkyloxy or heteroaryl lower alkyloxy, an optionally substituted aryl, heteroaryl or an optionally substituted aryl-lower alkyl group.

More preferably, R is an oxy group, e.g. C₁-C₇ alkoxy. Yet more preferably, R is a branched C₁-C₇ alkoxy or a substituted C₁-C₇ alkoxy. A preferred substituent for the substituted C₁-C₇ alkoxy is a furyl or benzofuryl which is optionally substituted.

R₉ is preferably hydrogen.

X is preferably selected from the group consisting of:

Most preferably, X is

¹H-NMR spectra are recorded on a Varian Gemini 400 MHz NMR spectrometer. Significant peaks are tabulated in the order: multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad) and number of protons. Electron Spray Ionization (ESI) mass spectra are recorded on a Hewlett Packard 5989A mass spectrometer. Mass spectrometry results are reported as the ratio of mass over charge. Preparative HPLC purifications are performed with XTerra™ RP18 19x150mm columns, using acetonitrile/water or MeOH/water as eluent systems. All reagents, starting materials and intermediates utilized in these examples are available from commercial sources or are readily prepared by methods known to those skilled in the art.

(1) (1-Benzyl-piperidin-4-yl)-carbamic acid tert-butyl ester (2)

1-Benzyl-piperidin-4-ylamine (50 g, 262.76 mmol) is dissolved in a mixture of 200 ml of water, 145 ml of 2 molar aqueous sodium hydroxide and 350 ml of t-BuOH at 0°C. A solution of Boc₂O (63.1 g, 1.1 equivalents) in 150 ml of t-BuOH is added dropwise within one hour at 0°C. A white suspension is formed which is allowed to stir overnight at room temperature. The reaction mixture is diluted with ether and washed with water,. The organic layers are dried over anhydrous sodium sulfate and evaporated under reduced pressure.

Yield: 71.5 g of a pale yellow solid (93%). MS (ESI): 291 [M+H]⁺, ¹H-NMR (DMSO-d₆): δ (ppm) 7.2–7.35 (m, 5H), 6.77 (br d, 1H), 3.44 (s, 2H), 3.22 (br m, 1H), 2.75 (m, 2H), 1.95 (dt, 2H), 1.68 (m, 2H), 1.38 (s, 9H), 1.36 (dt 2H).

(1) Step A: (3-Fluoro-phenoxy)-acetic acid ethyl ester (107)

3-Fluoro-phenol (100 g, 892 mmol) is dissolved in acetone (250 ml) and after addition of chloro-acetic acid ethyl ester (114 ml, 1.07 mol) and K₂CO₃ (249 g, 1.78 mol) the mixture is refluxed for 24h. After cooling down to 0°C, the mixture is filtrated and the filtrate is evaporated under reduced pressure. Yield: 198 g (100%) of a red oil.

(2) Step B: 2-(3-Fluoro-phenoxy)-3-oxo-succinic acid diethyl ester (108)

60% NaH in mineral oil (19.5 g, 488.4 mmol) is covered with 600 ml of dry diethyl ether. Ethanol (28.1 ml, 444 mmol) is added dropwise within 25 min. Then oxalic acid diethyl ester (66 ml, 488 mmol) is added dropwise within 20 min. After 10 min stirring at room temperature, the mixture is heated to reflux. A solution of **107** (88g, 444 mmol) in 80 ml of dry diethyl ether is added dropwise within 30 min and the mixture is allowed to reflux for 1 hour. After cooling down to room temperature, the reaction mixture is poured on 2M HCl (400 ml) / ice (400 g) and extracted with diethyl ether. The organic layers are dried over sodium sulfate, filtrated and evaporated. The crude product is purified by filtration over silica gel (ethyl acetate / hexane 1:1). Evaporation gave 140 g of an red oil. The mineral oil could be removed using a separatoty funnel. Yield: 132 g (100%).

(3) Step C: 6-Fluoro-benzofuran-2,3-dicarboxylic acid diethyl ester (109)

108 (66 g, 221.3 mmol) is dissolved in 245 ml of cooled (-15°C) conc. sulfuric acid and stirred for 3 h whereas the reaction mixture slowly warmed up to room temperature. Then the mixture is poured onto 1 kg of ice and extracted with diethyl ether. The organic layers are washed with brine, dried over sodium sulfate, filtrated and evaporated. The crude product is used in the next step without further purification.

Yield: 19.7 g (32%) of a yellow oil. MS (ESI): 281 [M+H]⁺, ¹H-NMR (DMSO-d₆): δ (ppm) 7.88 (dd, 1H), 7.82 (dd, 1H), 7.35 (ddd, 1H), 4.38 (m, 4H), 1.33 (t, 3H), 1.32 (t, 6H). The cyclisation gave exclusively the 6-substituted benzofurane.

(4) Step D: 6-Fluoro-benzofuran-3-carboxylic acid ethyl ester (110)

109 (40 g, 142.7 mmol) is dissolved in 300 ml of a DMSO and after addition of sodium chloride (16.7 g, 285.4 mmol) and water (5.1 ml) the mixture is stirred for 4h at 160°C (temperature of reaction mixture). Then the mixture is allowed to cool down and evaporated at high vacuum. The residue is dissolved in ethyl acetate, washed with water and brine and dried over sodium sulfate. Evaporation gave 14.8 g of an red oil, which is further purified by filtration over silica gel (ethyl acetate / hexanes 2:8).

Yield: 7.8 g (26%) of a yellow solid. MS (ESI): 208 [M]⁺, ¹H-NMR (DMSO-d₆): δ (ppm) 8.77 (s, 1H), 7.92 (dd, 1H), 7.68 (dd, 1H), 7.29 (ddd, 1H), 4.35 (q, 2H), 1.32 (t, 3H).

After completed addition the mixture is allowed to stir at rt for 2h. Then the reaction mixture is cooled to -15°C and 10 ml of a 1M NaOH solution is added very slowly. The the mixture is filtrated over celite and evaporation under reduced pressure gave 5.3 g of a yellow oil.

(6) Step F: 4-(6-Fluoro-benzofuran-3-ylmethoxy)-indole-1,2-dicarboxylic acid 1-tert-butyl ester 2-ethyl ester (112)

111 (2 g, 12 mmol), **102** (3.7 g, 12 mmol), triphenylphosphine (9.4 g, 36.1 mmol) and DIPEA (6.2 ml, 36.1 mmol) are dissolved in 50 ml of THF and cooled to 0°C. Then 40% ethyl azodicarboxylate solution in THF (15.7 ml, 36.1 mmol) is added dropwise. After completed

addition the mixture is stirred for 16h (TLC control) at rt. Then the mixture is evaporated under reduced pressure. The residue is diluted with ethyl acetate, washed sat. The compounds of formula I in free form or in pharmaceutically acceptable salt form exhibit valuable pharmacological properties, e.g. as CCR2 and CCR5 antagonists as indicated in in vitro tests as described below.

a) CCR2 membrane binding assay

The SPA (Scintillation Proximity Assay) technology is used to show that the test compounds prevent MCP-1 from binding to cell membranes expressing the CCR2 receptor. Transfected CHO-dukX cells stably expressing the hCCR2b gene are grown in MEM alpha medium to a confluency of between 70 and 80 %. After discarding the medium, 30 ml ice-cold physiological buffer solution containing 1 mM EDTA are added and the cells removed from the plate using a scraper. The cell suspension is centrifuged at 800 g for 10' at 4 °C and the cell pellet resuspended in buffer. Cell lysis is done using a Polytron PTI300D instrument at

28 000 RPM for 2 times 30 seconds on ice. Membranes are collected by centrifugation at 42 000 g for 20 minutes at 4 °C and subjected to a second round of lysis (Polytron, 28 000 RPM, 2x30 seconds on ice). Following centrifugation at 42 000 g for 20 minutes at 4 °C the membranes are resuspended in buffer at a protein concentration of 2 mg/ml and stored at -80 °C. Ten millimolar stock solutions of test compounds in 100% DMSO are prepared. Test compounds are further diluted in buffer to yield the four-fold concentrated solutions for the tests that assayed a range of 10^{-10} to 10^{-5} M. The SPA assay is performed in a final volume of 200 µl per well in 96 well plates. The components are added per well in the following order:

| | |
|-------|---|
| 50 µl | Buffer (+/- test compound) |
| 50 µl | Wheat germ agglutinin-SPA beads (1.25 mg/well) in buffer |
| 50 µl | CCR2B membrane suspension diluted with buffer to 0.04 mg/ml (2 µg/well), alternatively 50'000 cells per well |
| 50 µl | [¹²⁵ I] MCP-1 in buffer (60 pM final concentration, 2.5 µCi/plate) |

After addition of all components the plate is sealed and incubated for 90 minutes at room temperature with constant shaking. Following incubation the plate is centrifuged at 1000 RPM in a Sorvall RC3B centrifuge for 4 minutes at room temperature and counted for 3 minutes per well in a TOP COUNT instrument (Packard). The quench-corrected counts are used for the analysis of radioligand binding.

Compounds of formula I have an IC_{50} between 0.0003 and 10 µM.

In a similar manner, binding assays for the rat, mouse and rhesus monkey CCR2 receptors have been established. Due to the species specificity of the CCR2 antagonists, the compounds of formula I have an IC_{50} between 0.015 and 10 µM on mouse CCR2 and between 0.020 and 10 µM on rat CCR2.

b) CCR2 functional assay – Ca²⁺ mobilization

hCCR2b-CHO#84 cells:

CHOdukX cell line stably expressing the hCCR2 gene is grown in MEMα up to a confluence of 80%. The day before the experiment, cells are harvested from the tissue culture flask by trypsinization, washed, plated in a black/clear bottom 96-well plate at 5×10^4 cells per well and cultured overnight at 37°C in a humid atmosphere enriched with 5% CO₂. On the next

day, cells are washed twice and loaded for 1 hour at RT in the dark with 2 μ M Fluo-4 in buffer C. After two further washes, the cells are resuspended in buffer D. Serial dilutions of the compounds, in buffer D, are mixed with the cells and incubated for half an hour at RT in the dark. Cells are then stimulated by the injection of MCP-1 and calcium fluxes are monitored using the FlexstationTM, a benchtop scanning fluorometer with an integrated fluid transfer workstation.

hCCR2b-300.19 cells:

Pre-B cell line 300-19 stably expressing the hCCR2 gene (Loetscher et al., J. Biol. Chem. 276 (5), 2986-91 (2001)) is grown in RPMI 1640 with glutamax-I supplemented with 1X MEM non essential amino-acid, 1 mM sodium pyruvate, 5x10⁻⁵ M β -mercaptoethanol and 10 % FCS. For the experiment, the cells are used in the exponential growing phase, at a maximal concentration of 1.5x10⁶ cells per ml. Cells are washed in buffer A and loaded at about 2.10⁶ cells per ml in 2 μ M fluo-4 in buffer B for 30 min. in the dark, at 37°C in a waterbath. After two washes with buffer A, cells are plated in black/clear bottom 96-well plate at 2x10⁵ cells per well in buffer B. All following steps, including the compound and the chemokine dilutions, are performed as described above for the hCCR2b-CHO#84 cells, except that buffer B is used instead of buffer D.

In this assay, compounds of formula I have an IC₅₀ between 0.0005 and 10 μ M.

c) CCR2 functional assay – chemotaxis

An *in vitro* cell migration assay for CCR2-dependent chemotaxis based on TranswellTM membrane inserts is used to profile the compounds. The assay is performed with the human monocytic THP-1 cell line and activated peripheral blood lymphocytes (PBL). THP-1 cells are cultured in RPMI1640 supplemented with 10 % heat-inactivated FCS. Activated PBL are prepared from human blood by elutriation and then activated by culture on anti-human CD3-coated culture plates and expanded by subsequent culture in medium supplemented with IL-2. Aliquots of activated PBL are frozen in liquid nitrogen and used in migration experiments

after thawing and overnight culture. Cells from cultures at a density of less than 1.2×10^6 cells/ml are counted, washed and resuspended at an appropriate density in RPMI1640 containing 0.5 % BSA. Transwell™ membrane inserts of 6.5 mm diameter, 3 or 8 μ m pore size and tissue culture treated polycarbonate membrane are used for the migration assays. The transwell inserts are loaded with cells and compounds in a final volume of 100 μ l in RPMI1640/0.5 % BSA. For THP-1 cells, 8 μ m pore size inserts are used. For PBLs the use of 3 μ m pore size inserts resulted in lower non-specific counts. The inserts are placed in a 24-well tissue culture plate containing recombinant human MCP-1 and compounds in a final volume of 600 μ l. After allowing the cells to migrate to the bottom compartment, the assay is stopped by removing and discarding the transwell inserts. Cells in the bottom compartment are collected and counted on a FACScan flow cytometer by acquiring all events for 30 s with settings established for each cell type. Migration is expressed as absolute cell counts/30 s relative to the input cell number measured under the same conditions.

In this assay, compounds of formula I have an IC_{50} between 0.0012 and 10 μ M.

d) CCR5 membrane binding assay

Human CCR5 is used to generate stable transfectants in CHO K1 cells. Membranes prepared from these CCR5 transfectants are used in a radioligand binding assay using 125 I-MIP-1 α as a ligand and the compounds of formula I are tested for inhibitory activity. The data are reported as IC_{50} , i.e. the concentration of compound required to achieve 50% inhibition of [125 I]MIP-1 α binding. In this assay, compounds of formula I have an IC_{50} between 0.004 and 10 μ M.

cancer with leukocyte infiltration of the skin or organs; breast cancer;

stenosis or restenosis of the vasculature, particularly of the arteries, e.g. the coronary artery, including stenosis or restenosis which results from vascular intervention, as well as neointimal hyperplasia; stroke; and other diseases or conditions involving inflammatory responses including reperfusion injury, hematologic malignancies, cytokine induced toxicity (e.g. septic shock or endotoxic shock), polymyositis, dermatomyositis, and granulomatous diseases including sarcoidosis; infectious diseases, including HIV and AIDS.

The term "treatment" as used herein is to be understood as including both therapeutic and prophylactic modes of therapy e.g. in relation to the treatment of neoplasia, therapy to prevent the onset of clinically or preclinically evident neoplasia, or for the prevention of initiation of malignant cells or to arrest or reverse the progression of premalignant to malignant cells, as well as the prevention or inhibition of neoplasia growth or metastasis. In this context, the present invention is, in particular, to be understood as embracing the use of compounds of the present invention to inhibit or prevent development of skin cancer, e.g. squamous or basal cell carcinoma consequential to UV light exposure, e.g. resultant from chronic exposure to the sun.

Agents of the Invention are particularly useful for treating diseases of bone and cartilage metabolism including osteoarthritis, osteoporosis and other inflammatory arthritides, e.g. rheumatoid arthritis, and bone loss in general, including age-related bone loss, and in particular periodontal disease.

The Agents of the Invention may also be used in ocular applications which include the treatment of ocular disorders, in particular of ocular inflammatory disorders, of ocular pain including pain associated with ocular surgery such as PRK or cataract surgery, of ocular allergy, of photophobia of various etiology, of elevated intraocular pressure (in glaucoma) by inhibiting the production of trabecular meshwork inducible glucocorticoid response (TIGR) protein, and of dry eye disease.

For the above indications, the appropriate dosage will, of course, vary depending upon, for example, the particular Agent of the Invention to be employed, the subject to be treated, the mode of administration and the nature and severity of the condition being treated. However,

in prophylactic use, satisfactory results are generally indicated to be obtained at dosages from about 0.05 mg to about 10 mg per kilogram body weight, more usually from about 0.1 mg to about 5 mg per kilogram body weight. The frequency of dosing for prophylactic use will normally be in the range from about once per week up to about once every 3 months, more usually in the range from about once every 2 weeks up to about once every 10 weeks, e.g. once every 4 or 8 weeks. Agent of the Invention is conveniently administered parenterally, intravenously, e.g. into the antecubital or other peripheral vein, intramuscularly, or subcutaneously. For example, a prophylactic treatment typically comprises administering the Agent of the Invention once per month to once every 2 to 3 months, or less frequently.

The Agents of the invention may be administered in combination with another active agent. Suitable active agents include antimetabolites (e.g. methotrexate), anti-TNF agents (e.g. Remicade[®] (infliximab), Enbrel[®] (Etanercept), Humira[®] (adalumimab)), anti-IL-1 agents (e.g. pralnacasan, ACZ885), nucleoside and non-nucleoside revers transcriptase inhibitors, HIV protease inhibitors, fusion inhibitors and other antiretroviral agents. The active agent or agents may be administered simultaneously, separately or sequentially with the Agent of the invention.

Pharmaceutical compositions of the invention may be manufactured in conventional manner. A composition according to the invention is preferably provided in lyophilized form. For immediate administration it is dissolved in a suitable aqueous carrier, for example sterile water for injection or sterile buffered physiological saline. If it is considered desirable to make up a solution of larger volume for administration by infusion rather as a bolus injection, it is advantageous to incorporate human serum albumin or the patient's own heparinised blood into the saline at the time of formulation. The presence of an excess of such physiologically inert protein prevents loss of antibody by adsorption onto the walls of the container and tubing used with the infusion solution. If albumin is used, a suitable concentration is from 0.5 to 4.5% by weight of the saline solution.

The Agents of the Invention may be administered by any conventional route, e.g. orally, for example in the form of solutions for drinking, tablets or capsules or parenterally, for example in the form of injectable solutions or suspensions. Normally for systemic administration oral dosage forms are preferred, although for some indications the Agents of the Invention may also be administered topically or dermally, e.g. in the form of a dermal cream or gel or like

preparation or, for the purposes of application to the eye, in the form of an ocular cream, gel or eye-drop preparation; or may be administered by inhalation, e.g., for treating asthma. Suitable unit dosage forms for oral administration comprise e.g. from 25 to 250mg of Agent of the Invention per unit dosage.
